Dacca, 20th June, 1835.

V.—Register of the Thermometer at Ambála, for 1834. By M. P. EDGEWORTH, Esq. C. S.

[Having a great many registers of daily observations on hand, for which we have hitherto been unable to find space, we have been obliged to confine ourselves to the publication of monthly abstracts; but we have prepared a copper-plate, in which we hope shortly to exhibit the daily observations both of Barometer and Thermometer for many localities in the same view, and in very limited space.—ED.]

I have the pleasure of enclosing a register of the thermometer at this place for last year. The temperature during the hot weather is probably considerably too high, in consequence of the situation of the thermometers in the fort town where I then resided; but I hope this year to obtain a fairer estimate, as I have now moved into a bungalow, and the thermometers are placed in the north veranda, very little exposed to glare, &c. Finding that there was scarcely any difference between the means deduced from the extreme temperature during the day and that from the temperature at 10 A. M. and 10 P. M., I have discontinued the latter. For the greater part of the year the maximum and minimum are the extremes, according to the register thermometer; but as frequently I am absent from this place on business in the district, a native (on whose accuracy I can place confidence) registers the temperature at sunrise, and at half past two in the cold, and three in the hot, season, which I have observed to be the hottest time of the day respectively.
